

FACULTY OF VETERINARY & AGRICULTURAL SCIENCES The effects of amino acid and proteins on foaming and bubbles in sparkling wine

> Bruna Lima June 2018

INTRODUCTION

• Proteins are the main compounds associated with foam properties of sparkling wines.

foam volume foam height foam stability

- Proteins have a positive effect on foam formation
- Increase of 20% of proteins resulted in increase of foam height
- Sparkling wines deprived of molecules > 3.5 kDa did not produce any measurable foam.
- Sparkling wines containing glycosilated compounds and yeast mannoproteins have showed higher foam ability then wines containing just grape proteins
- Higher foaming ability for wines containing both grape (+) and yeast mannoproteins (-).

- Free amino acids in sparkling wines have been correlated with foaming parameters
- Significant correlations between foam stability and histidine, arginine and tyrosine (Culbert et al. 2017).
- However, the mechanism by which they contribute to foam stability remains unclear.
- Bubbles stabilization is very complex, more likely to be resulted from poly-macromolecular associations rather than of a single family of compounds

Culbert, J. A., McRae, J. M., Condé, B. C., Schmidtke, L. M., Nicholson, E. L., Smith, P. A., Howell, K. S., Boss, P. K. and Wilkinson, K. L. (2017) 'Influence of Production Method on the Chemical Composition, Foaming Properties, and Quality of Australian Carbonated and Sparkling White Wines', J. Agric. Food Chem., 65 (7), 1378-1386

Recent findings

 protein and amino acids content were significantly correlated to parameters representative of foam stability

J. Agric. Food Chem. 2017, 65 (41), 9110-9119

Recent findings

J. Agric. Food Chem. 2017, 65 (41), 9110-9119

Recent findings (unpublished)
