

Fortifying the future of NSW Wine

What the numbers mean, a
regional snapshot of smoke
taint data

Con Simos

Data interpretation

- ❖ The anonymised data is limited to samples analysed by AWRI Commercial Services and smoke taint interpretation reports issued by the AWRI Helpdesk.
- ❖ Cross validation study was undertaken by AWRI Commercial Services and Vintessentials
 - Copy of report available for download
 - [Smoke-analysis-cross-validation-report-FINAL-30-Nov-2020.pdf \(awri.com.au\)](https://www.awri.com.au/files/Smoke-analysis-cross-validation-report-FINAL-30-Nov-2020.pdf)
- ❖ The AWRI technique analyses for
 - 7 volatile phenols
 - 6 bound glycosides
- ❖ For simplicity, results expressed as sum of 'total glycosides' for grape samples only.

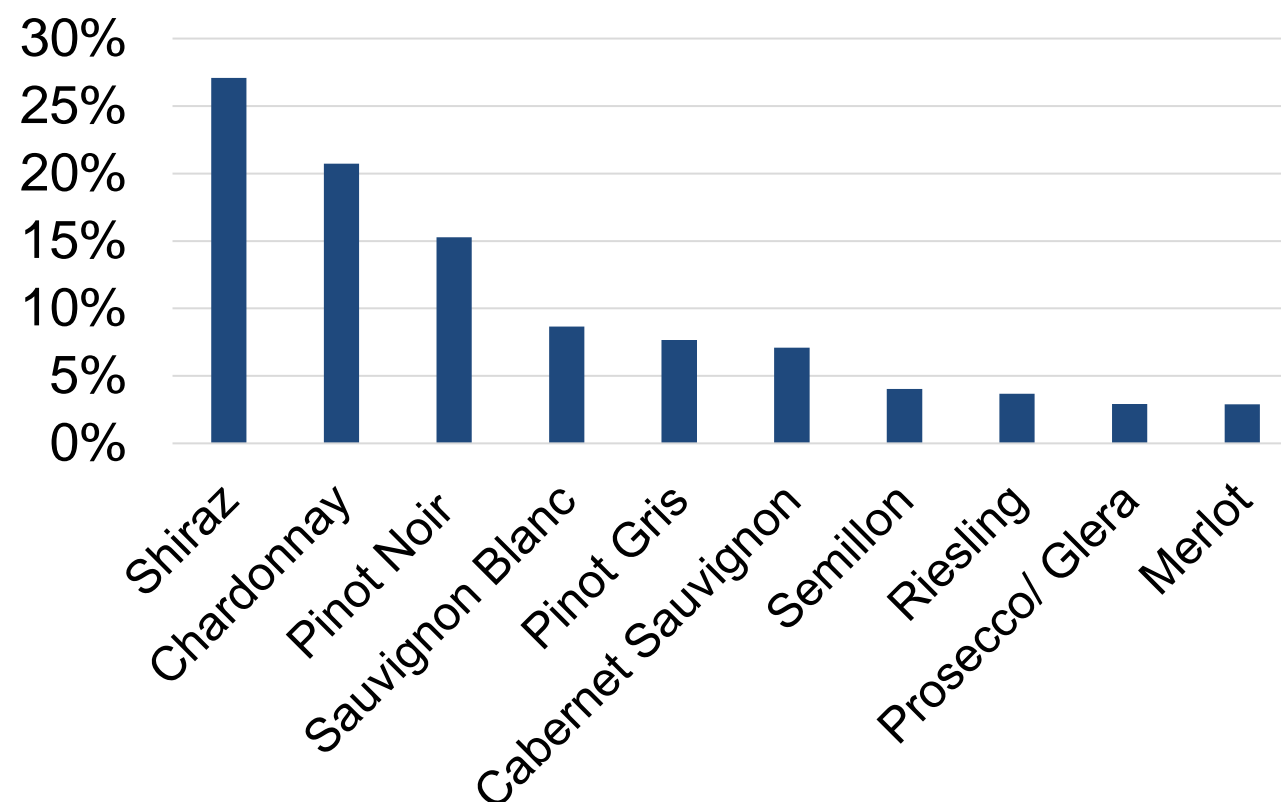

AWRI Helpdesk Smoke taint interpretations 2019 - 2020

❖ From NSW

- 1,305 samples
- 221 producers
- 45 varieties, 25 Red and 20 White

Top ten varieties sampled

Samples analysed by origin - NSW

Breakdown by sample type - NSW

Sampling period

Range of total glycosides linked to assessed level of smoke risk

| Smoke taint risk category (draft industry) | Total glycosides concentration ($\mu\text{g/kg}$) ¹ | Grape samples in total: NSW dataset n=1,032 | Grape samples in total: Adelaide Hills dataset n=642 | Grape samples in total: All Helpdesk and all locations 2015 – 2019 dataset n=199 |
|--|--|---|--|--|
| A | <30 | 5% | 41% | 56% |
| B | $30 \leq 80$ | 20% | 38% | 33% |
| C | $80 \leq 150$ | 19% | 14% | 4% |
| D | $150 \leq 300$ | 22% | 6% | 3% |
| E | ≥ 300 | 34% | 1% | 4% |

¹‘Total glycosides’ concentration is the sum of the six individual phenolic glycoside results for a sample.

Breakdown by sample type – Hunter Valley

Total samples submitted: 538

Samples analysed by variety – Hunter Valley

Five varieties listed
constitute 88% of all
samples submitted
In total, samples from 25
varieties were submitted

Total Glycosides¹ found in the most common varieties – Hunter Valley

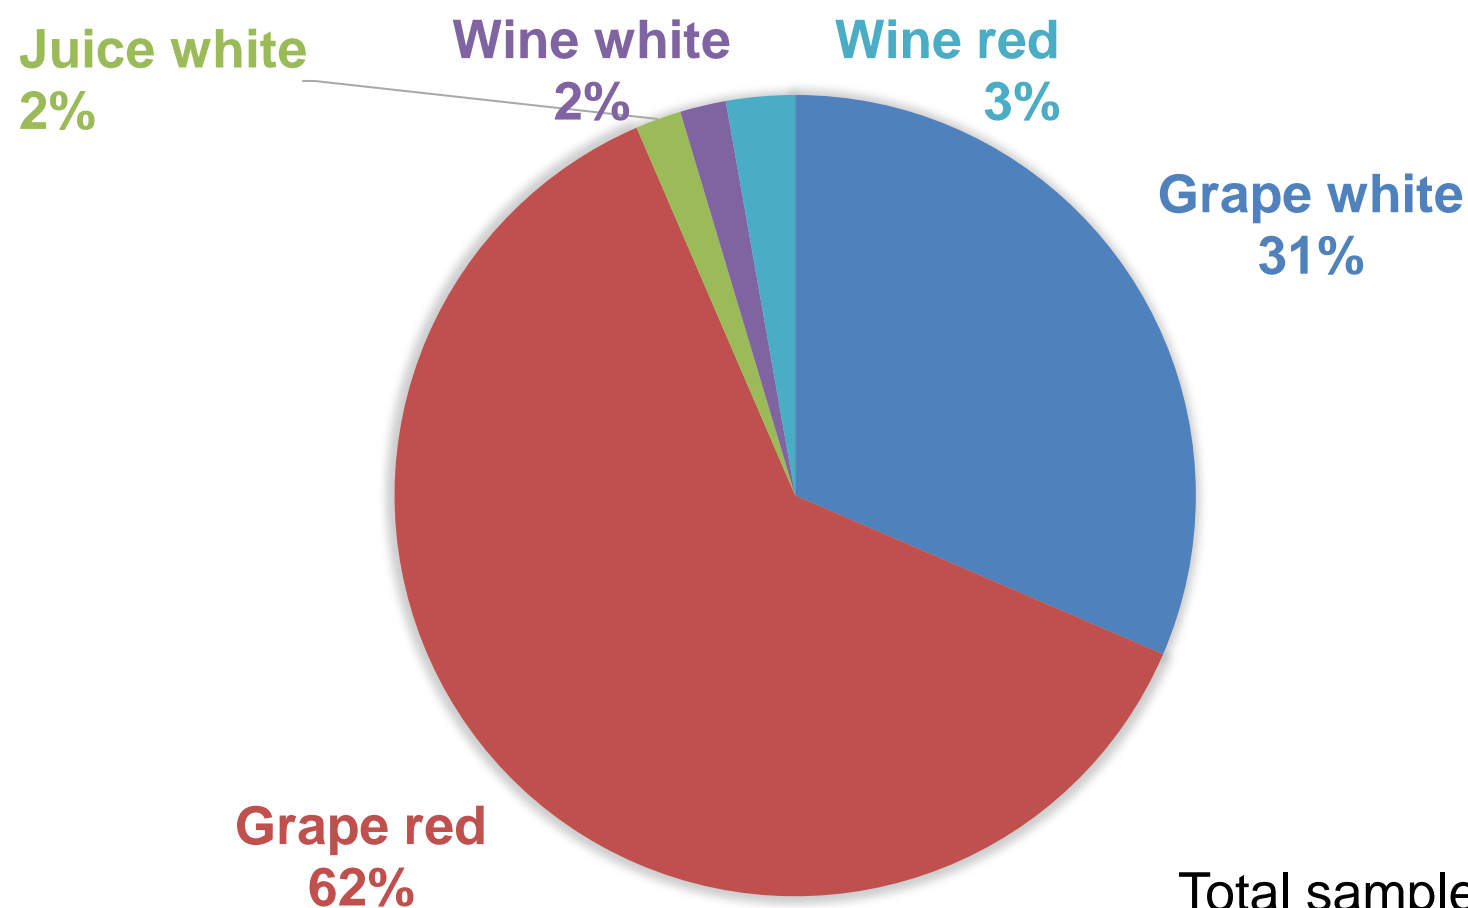

| Location | Variety | Minimum | Maximum | Average concentration | Background upper limit ² | Percentage of samples above the background upper limit |
|---------------|------------|---------|---------|-----------------------|-------------------------------------|--|
| NSW | Chardonnay | 3.5 | 2677 | 232 | 8.9 | 99% |
| Hunter Valley | Chardonnay | 7 | 819 | 150 | 8.9 | 98% |
| NSW | Semillon | 15 | 521 | 346 | 10 | 100% |
| Hunter Valley | Semillon | 15 | 521 | 109 | 10 | 100% |
| NSW | Shiraz | 16.5 | 1835 | 297 | 37.4 | 96% |
| Hunter Valley | Shiraz | 16.5 | 1395 | 191 | 37.4 | 96% |

1 Total glycosides' concentration is the sum of the individual glycoside results for a sample.

2 This is the maximum 'total glycosides' value that might be expected for non-smoke-exposed grapes.

Breakdown by sample type – Canberra

Total samples submitted: 108

Samples analysed by variety – Canberra

Five varieties listed
constitute 68% of all
samples submitted
In total, samples from 20
varieties were submitted

Total Glycosides¹ found in the most common varieties – Canberra

| Location | Variety | Minimum | Maximum | Average concentration | Background upper limit ² | Percentage of samples above the background upper limit |
|----------|----------|---------|---------|-----------------------|-------------------------------------|--|
| NSW | Shiraz | 16.5 | 1835 | 297 | 37.4 | 96% |
| Canberra | Shiraz | 112 | 1193 | 693 | 37.4 | 100% |
| NSW | Riesling | 61 | 1593 | 372 | 11.7 | 100% |
| Canberra | Riesling | 584 | 1344 | 822 | 11.7 | 100% |

1 Total glycosides' concentration is the sum of the individual glycoside results for a sample.

2 This is the maximum 'total glycosides' value that might be expected for non-smoke-exposed grapes.

Breakdown by sample type – Southern Highlands

Samples analysed by variety – Southern Highlands

Eight varieties listed
constitute 75% of all
samples submitted
In total, samples from 23
varieties were submitted

Total Glycosides¹ found in the most common varieties – Southern Highlands

| Location | Variety | Minimum | Maximum | Average concentration | Background upper limit ² | Percentage of samples above the background upper limit |
|--------------------|------------|---------|---------|-----------------------|-------------------------------------|--|
| NSW | Pinot Noir | 12.5 | 1508 | 304 | 14.9 | 99% |
| Southern Highlands | Pinot Noir | 112 | 1193 | 693 | 14.9 | 100% |
| NSW | Chardonnay | 3.5 | 2677 | 232 | 8.9 | 99% |
| Southern Highlands | Chardonnay | 322 | 1391 | 521 | 8.9 | 100% |

1 Total glycosides' concentration is the sum of the individual glycoside results for a sample.

2 This is the maximum 'total glycosides' value that might be expected for non-smoke-exposed grapes.

Breakdown by sample type – Tumbarumba

Total samples submitted: 39

Samples analysed by variety – Tumbarumba

Two varieties listed
constitute 80% of all
samples submitted
In total, samples from 7
varieties were submitted

Total Glycosides¹ found in the most common varieties – Tumbarumba

| Location | Variety | Minimum | Maximum | Average concentration | Background upper limit ² | Percentage of samples above the background upper limit |
|------------|------------|---------|---------|-----------------------|-------------------------------------|--|
| NSW | Pinot Noir | 12.5 | 1508 | 304 | 14.9 | 99% |
| Tumbarumba | Pinot Noir | 585 | 1376 | 944 | 14.9 | 100% |
| NSW | Chardonnay | 3.5 | 2677 | 232 | 8.9 | 95% |
| Tumbarumba | Chardonnay | 906 | 2677 | 1473 | 8.9 | 100% |

1 Total glycosides' concentration is the sum of the individual glycoside results for a sample.

2 This is the maximum 'total glycosides' value that might be expected for non-smoke-exposed grapes.

Breakdown by sample type – Mudgee

Samples analysed by variety – Mudgee

Five varieties listed
constitute 73% of all
samples submitted
In total, samples from 20
varieties were submitted

Total Glycosides¹ found in the most common varieties – Mudgee

| Location | Variety | Minimum | Maximum | Average concentration | Background upper limit ² | Percentage of samples above the background upper limit |
|----------|------------|---------|---------|-----------------------|-------------------------------------|--|
| NSW | Shiraz | 16.5 | 1835 | 297 | 37.4 | 96% |
| Mudgee | Shiraz | 160 | 593 | 275 | 37.4 | 100% |
| NSW | Chardonnay | 3.5 | 2677 | 372 | 8.9 | 99% |
| Mudgee | Chardonnay | 104 | 776 | 336 | 8.9 | 100% |

1 Total glycosides' concentration is the sum of the individual glycoside results for a sample.

2 This is the maximum 'total glycosides' value that might be expected for non-smoke-exposed grapes.

Breakdown by sample type – Orange

Total samples submitted: 171

Samples analysed by variety – Orange

Total Glycosides¹ found in the most common varieties – Orange

| Location | Variety | Minimum | Maximum | Average concentration | Background upper limit ² | Percentage of samples above the background upper limit |
|----------|------------|---------|---------|-----------------------|-------------------------------------|--|
| NSW | Pinot Noir | 12.5 | 1508 | 304 | 14.9 | 99% |
| Orange | Pinot Noir | 42 | 202 | 151 | 14.9 | 100% |
| NSW | Chardonnay | 3.5 | 2677 | 232 | 8.9 | 99% |
| Orange | Chardonnay | 36 | 447 | 140 | 8.9 | 100% |

1 Total glycosides' concentration is the sum of the individual glycoside results for a sample.

2 This is the maximum 'total glycosides' value that might be expected for non-smoke-exposed grapes.

Background levels database

- ❖ The background levels data for Australian grapes (pages 39–42)
 - <https://www.wineaustralia.com/getmedia/57a45b58-3eb6-416a-bdf3-c54faeb2d766/AWR-1603-Final-Report-including-attachments.pdf>

Background levels database with grape and wine data

| White Varieties | Red Varieties |
|------------------------|--------------------|
| Chardonnay | Shiraz |
| Pinot Gris | Cabernet Sauvignon |
| Sauvignon Blanc | Pinot Noir |
| Viognier | Grenache |
| Riesling | Merlot |
| Muscat Gordo | Mataro |
| Gewürtztraminer | Durif |
| Verdelho | Sangiovese |
| Semillon | Tempranillo |

Current database contains data for 548 grape samples and 517 wine samples, with at least two vintages (but up to four) except Mataro. This project will add five varieties, specific to NSW, consisting of 100 grape and 100 wine samples.

Fortifying the future of NSW Wine

The Australian Wine
Research Institute

Early season smoke exposure

learnings from 2019/20 bushfires for Hunter Valley and Adelaide Hills regions

Dr Markus Herderich, GM-Research

November 2021

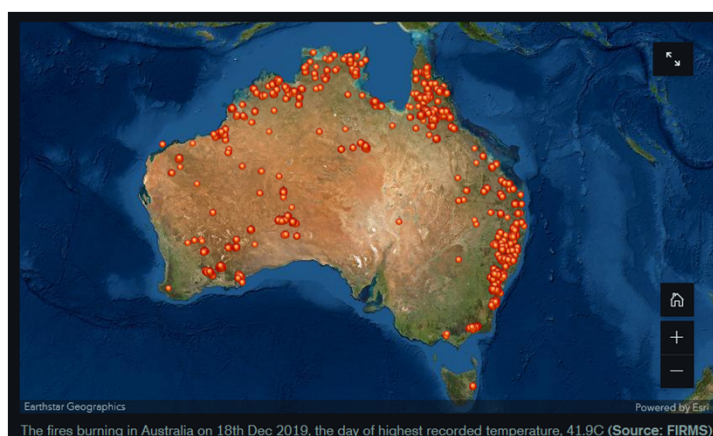

1

Looking back: Australian vintage 2019/20

The Australian Wine
Research Institute

❖ **prelude:** after years of drought....

2

Looking back: Australian vintage 2019/20

The Australian Wine Research Institute

- ❖ **prelude:** years of drought
- ❖ **very early start to the bushfire season in September 2019**
 => *whats the risk of smoke taint*
if green pea-size pre-veraison berries get exposed?

- ❖ **scale and intensity of wildfires**
 186,000 square km,
 temperate rain forests burning
 weeks to months of smoke drift in some regions
 vineyards burning in fast&furious fires

=> *how to re-vitalise burnt vines & vineyards?*

=> *identify clean grapes ⇔ winemaking with grapes after some smoke exposure*

=> *smoke taint risk in bulk wine, reliable sensory assessment of smoke taint in wine*

3

smoke exposure of unripe grapes

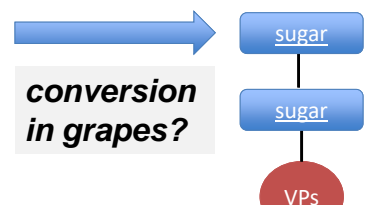

The Australian Wine Research Institute

uptake?

other storage forms?

conversion in grapes?

SyGG

syringol gentiobioside

retained or diluted?

converted & disappear?

4

Hunter Valley 2019

Chardonnay & Shiraz grapes and leaves from 3 vineyards

The Australian Wine Research Institute

5x time points from 15 Nov to 10 Jan;
3 vineyard replicates
= 180 samples

EPA air stations @Bulga, Singleton;
PM₁₀ as proxy for fine dust and haze

Citation: Jiang, W.; Parker, M.; Hayasaka, Y.; Simos, C.; Herderich, M. Compositional Changes in Grapes and Leaves as a Consequence of Smoke Exposure of Vineyards from Multiple Bushfires across a Ripening Season. *Molecules* 2021, 26, 3187. <https://doi.org/10.3390/molecules26113187>

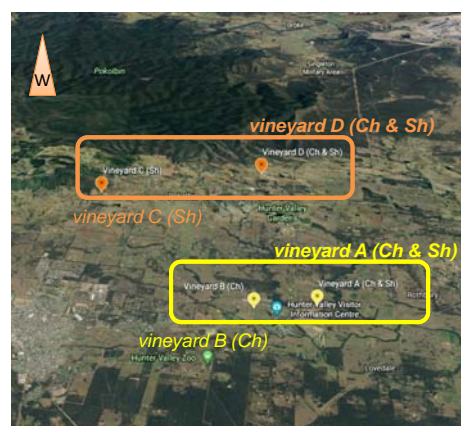

5

Hunter Valley vineyard monitoring => location matters

The Australian Wine Research Institute

exposure marker SyGG (ng/berry, HPLC-MS; all time points Nov - Jan)

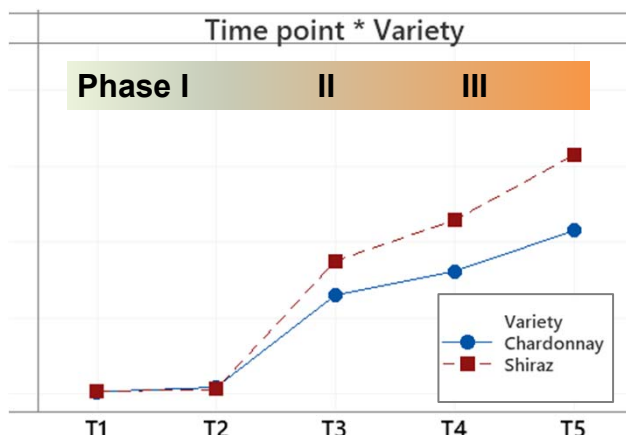

6

Hunter Valley – smoke exposure throughout ripening

exposure marker SyGG (ng/berry, HPLC-MS; all vineyards)

The Australian Wine Research Institute

- ✓ haze @T1,T2 ≠ taint markers in grapes
 - leaves were also 'clean'
 - no evidence for other chemistries

- ✓ peak fire activity and increase in smoke exposure markers in early December
 - exposure in November, detected delayed in 16 December?

- ✓ cumulative exposure December to January: increasing smoke exposure markers, and berry size increases

| date | 15 Nov | 29 Nov | 16 Dec | 28 Dec | 10 Jan |
|------------|--------|--------|--------|--------|--------|
| berry size | 0.14 g | 0.37 g | 0.53 g | 0.74 g | 0.89 g |
| EL stage | 27-32 | 32 | 33 | 35 | 36-37 |

7

Smoke haze & smoke markers in grapes & leaves: Hunter Valley 2019, Chardonnay & Shiraz

The Australian Wine Research Institute

Nulkaba north of Cessnock
6th Dec 2:15pm

| date | 15 Nov | 29 Nov | 16 Dec | 28 Dec | 10 Jan |
|------------|--------|--------|--------|--------|--------|
| berry size | 0.14 g | 0.37 g | 0.53 g | 0.74 g | 0.89 g |
| EL stage | 27-32 | 32 | 33 | 35 | 36-37 |

watch out: data from Adelaide Hills

8

Smoke haze & smoky odours in air: *what you see is not what you smell or taste*

The Australian Wine
Research Institute

- guaiacol is ca 200,000x more potent in air than wine

| guaiacol in wine | | guaiacol odour threshold [ng/L air] | | | odour qualities |
|---|-------------------------------|--|-------------|----------------------|-----------------------------|
| baseline (Shiraz wine) | odour threshold | median | range | factor (high/low) | <u>smoky</u> , vanilla, ham |
| 5.9 µg/L | 23 µg/L | 0.084 ng/L air | 0.007 – 3.7 | 529 | |
| Coulter et al. AJGWR (2021) accepted | Parker et al. JAFRC (2012) | Schranz et al. Food Chemistry 232 (2017) 808–819 | | | |

9

Early season smoke exposure: *Adelaide Hills - Cudlee Creek fire*

The Australian Wine
Research Institute

- **single fire event** 20 Dec 2019
- **berries ca EL29**
- **fast & furious**
- **fires burning nearby and within vineyards, plus smoke drift**
- **large volume of smoke during first 48 hours**
- 4 January 'contained'
- 22 January 'safe' (out)

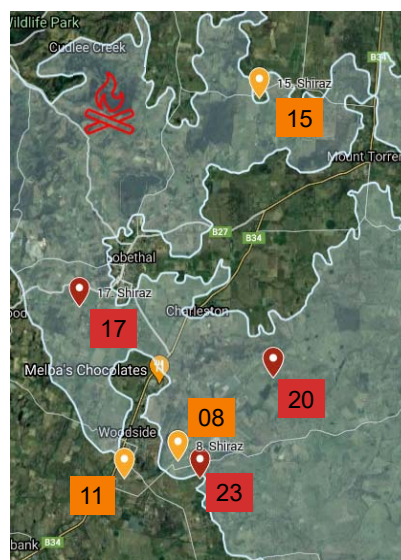

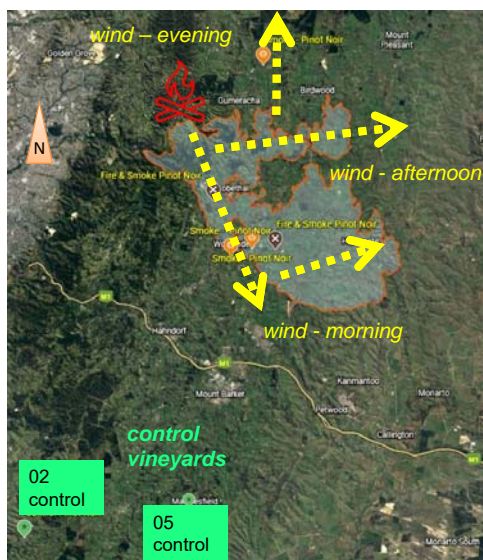

- grape – wine – sensory data
Shiraz, Pinot Noir, Chardonnay
24 blocks

10

Early season smoke exposure: Adelaide Hills Shiraz blocks- Cudlee Creek fire

The Australian Wine
Research Institute

11

Early season smoke exposure: grapes – wine – sensory Adelaide Hills Shiraz from Cudlee Creek fire

The Australian Wine
Research Institute

12

Early season smoke exposure: grapes – wine – sensory Adelaide Hills Shiraz from Cudlee Creek fire

The Australian Wine Research Institute

13

Early season smoke exposure: learnings from bushfire season 2021/20 Hunter Valley and Adelaide Hills

The Australian Wine Research Institute

- ✓ *significant risk of smoke taint in wine*
after green pea-size pre-veraison berries get exposed
- ✓ *vineyard location matters*
- ❑ *variety, phenology effects?*
- ❑ *unexpected observations (Adl Hills):*
 - ❑ *berry size increase did not result in 'dilution' of smoke markers in grapes*
 - ❑ *changes in smoke exposure marker profiles in grapes between January 2020 and March 2020*

2

Rewind to late 2019

The Australian Wine
Research Institute

- ❖ Pre-veraison smoke low risk
- ❖ Smoke exposure markers
 - 7 volatile phenols
 - 6 glycosides
 - Known abundance of markers in non-smoke exposed berries and wine
- ❖ But what concentration is likely to result in 'smoke taint' in wine?
 - Individually, guaiacol, *m*-cresol most potent
 - Subthreshold additive effects
 - Glycosides can give flavour in mouth, due to enzyme released volatiles
- ❖ When to try remediation?

3

Research trial initiated

The Australian Wine
Research Institute

- ❖ Aim: to link grape composition, wine composition, wine sensory
- ❖ Targeting the 'grey zone'
- ❖ Chardonnay, Pinot Noir and Shiraz
- ❖ 42 grape and wine pairs, with smoke sensory rating
- ❖ No remediation, 50 kg standard research winemaking (whites off skins)
- ❖ Including clean controls
- ❖ No oak

4

Smoke markers in wine –research wines

The Australian Wine
Research Institute

- ❖ Most abundant are guaiacol, syringol, *o*-cresol and *m*-cresol
- ❖ SumVols sum of these seven volatile phenols
- ❖ Controls removed, just 34 smoke exposed samples

5

Smoke markers in wine –research wines

The Australian Wine
Research Institute

- ❖ Syringol gentiobioside (SyGG) most abundant in smoke affected wines
- ❖ SumGlycos sum of these six glycosides
- ❖ Controls removed, just 34 smoke exposed samples

6

Can we predict smoke taint?

The Australian Wine
Research Institute

- ❖ Wine composition and sensory
- ❖ NB Variations in basic wine chemistry, pH, TA, alcohol

7

Smoke exposure markers vs wine sensory

The Australian Wine
Research Institute

8

Smoke compounds in grapes and wine

The Australian Wine Research Institute

9

Markers for smoke exposure

The Australian Wine Research Institute

Guaiacol 23 µg/L

'smoky', 'sweet smoke', 'smoky bacon'

4-Methylguaiacol 65 µg/L

'smoky', 'spicy'

Syringol 570 µg/L

'smoky', 'charry' (10% ethanol)

4-Methylsyringol 10,000 µg/L

'smoky', 'charry' (water)

o-Cresol 62 µg/L

'phenol', 'plastic'

m-Cresol 20 µg/L

'smoky, phenolic', 'smoky bandaid', 'plastic'

p-Cresol 64 µg/L

'faecal, horse stable-like', 'medicinal'

10

Smoke flavour and guaiacol per variety

The Australian Wine
Research Institute

- ❖ Consumers didn't mind 25 $\mu\text{g/L}$ guaiacol alone spiked into Merlot but many disliked 50 $\mu\text{g/L}$
- ❖ Guaiacol is not unpleasant by itself at moderate concentration, but is a major part of the smoke taint puzzle
- ❖ All **unoaked** wines

11

Smoke flavour and *m*-cresol per variety

The Australian Wine
Research Institute

- ❖ GuRG and MGGuRG also highly correlated with smoke flavour
- ❖ PhRG generally less correlated with smoke flavour
- ❖ *o*-cresol also highly correlated in Pinot Noir, and *p*-cresol in Shiraz
- ❖ Syringol and methylsyringol not correlated with smoke flavour

12

More complex predictive models

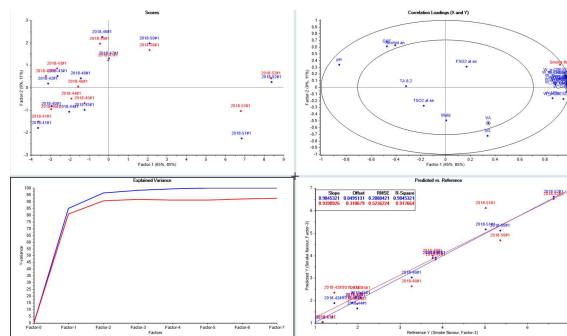

The Australian Wine
Research Institute

❖ PLS regression models with multiple compounds improve prediction

- Chardonnay PLS $R^2=0.93$
- Pinot Noir PLS $R^2=0.98$
- Shiraz PLS $R^2=0.96$

❖ Guaiacol, *m*-cresol, *p*-cresol, GuRG are important

❖ NB all UNOAKED wines

13

Do consumers dislike smoky wines?

The Australian Wine
Research Institute

14

Consumer liking and Smoke flavour by AWRI Panel

The Australian Wine
Research Institute

- ❖ Pinot Noir rosé diluted with a commercial wine in varying proportions
- ❖ Liking (inversely) correlated with smoke flavour rating from a separate trained sensory panel

15

Pinot Noir Rosé – Consumer clusters

The Australian Wine
Research Institute

16

Conclusions

The Australian Wine
Research Institute

- ❖ Markers are working well
 - To identify clean vs smoke exposed
 - To predict smoky flavour
 - Guaiacol, cresols, guaiacol glycosides most important
 - Separate varieties
- ❖ Rigorous sensory is important
- ❖ Consumer liking is strongly (negatively) correlated with smoke flavour
- ❖ Now establishing limits based on chemistry, smoke flavour intensity and consumer liking scores, to define 'taint'

17

Fortifying the future of NSW Wine

Do winemaking remediation treatments work?

Dr. Julie Culbert

Research Scientist

julie.culbert@awri.com.au

Do winemaking remediation treatments work?

- ❖ In some instances, yes!
- ❖ It's not black and white, lots of grey
- ❖ Dependent on level of taint
- ❖ Easier for whites than for reds

Remediation methods evaluated

- ❖ Carbon treatment of juice
- ❖ Carbon treatment of wine
- ❖ Nanofiltration of wine (with and without enzyme treatment)
- ❖ Treatment of wine with glycosidases (in conjunction with carbon or NF)
- ❖ Dilution with non-smoke-affected wine
- ❖ Use of untoasted oak chips

Carbon treatment of smoke-affected juice

The Australian Wine
Research Institute

- ❖ Two activated carbon products were selected for small-scale (50 Litres) winemaking trials
 - 2019 smoke affected Chardonnay and Pinot Noir juice
 - Carbon treatment prior to fermentation (1, 2 & 4 g/L)
 - Sensory analysis to evaluate sensory impact of treatments

Impact on smoke glycosides

The Australian Wine
Research Institute

- ❖ Percentage of total phenolic glycosides (n=6) remaining in free run juice after activated carbon treatment

Starting total phenolic glycosides – 335 µg/L for Pinot Noir; 253 µg/L for Chardonnay

Sensory analysis results - Pinot Noir Rosé

Winemaker thoughts – carbon treatment of wine

The Australian Wine
Research Institute

Winemaker comments:

- ❖ Some carbons appeared to strip the positive attributes of the wine, yet the smoke characters remained in the wine
- ❖ The best performing carbons were the ones most respectful of the fruit, as well as reducing some of those smoke characters

The most favoured carbons by winemakers in trials were:

- ❖ Enartis Fenol Free
- ❖ Vason FPS
- ❖ Enartis Black PF
- ❖ Victus International Granucol GE

DOSE MATTERS! It's important to optimise

Results from glycosidase use

The Australian Wine Research Institute

Comparison of control (pre) and enzyme treated (post) wines

Temp = Tempranillo; CHA = Chardonnay; PN = Pinot Noir; SHZ = Shiraz; Mus = Muscat;
VPs = volatile phenols; Glycs = glycosides

Results for nanofiltration

The Australian Wine
Research Institute

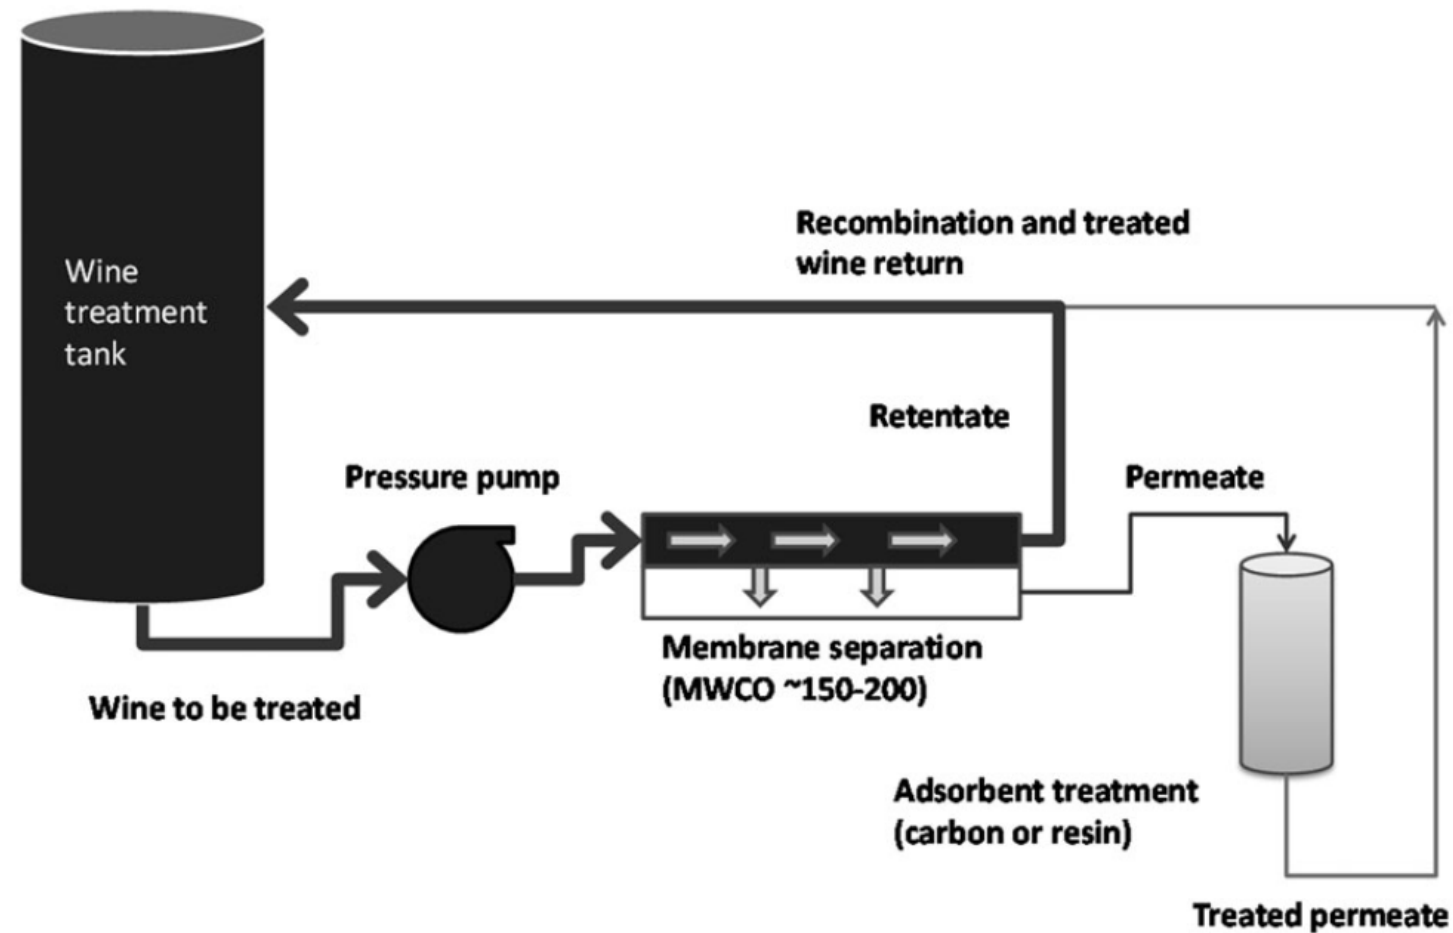

Temp = Tempranillo; NF = nanofiltration; VPs = volatile phenols; Glycs = glycosides

The nanofiltration process

The Australian Wine
Research Institute

Source: Fudge, A.L., Ristic, R., Wollan, D. and Wilkinson, K.L. (2011) Amelioration of smoke taint in wine by reverse osmosis and solid phase adsorption. *Australian Journal of Grape and Wine Research* 17, S41–S48.

❖ % of smoke affected wine – 100, 50, 25, 12.5 6.25 and 0

Flavour attributes

Smoke affected wine
57 $\mu\text{g/L}$ total volatile phenols (n=7)
209 $\mu\text{g/L}$ total phenolic glycosides (n=6)

Case Study 1

- ❖ Smoke-affected Pinot Noir wine
- ❖ 2 x 70,000L tanks
- ❖ Treated by nanofiltration and carbon (Flavoclean IOC 0.25 g/L)
- ❖ Blended – smoke-affected wine was 83% of the final blend
- ❖ Other additions (Uvagam APG 2400 (colour); Copper; Maxigum Arabic 20% liquid)
- ❖ Entered into numerous wine shows and no mention of smoke
- ❖ Being sold through a large supermarket chain who is buying pallets and pallets of the wine

Case study 2

- ❖ Grapes with low level smoke exposure
- ❖ 400,000 L of Prosecco juice treated with carbon (PS1300 0.5 g/L)
- ❖ Production of wine without any detectable smoke character – slightly stripped of fruit but it was a usable product that could be blended

Other treatments - untoasted oak

The Australian Wine
Research Institute

SHZ1 = Shiraz 1; PN = Pinot Noir; SHZ2 = Shiraz 2; VPs = volatile phenols; Glycs = glycosides

For SHZ1, PN and SHZ2 untoasted oak chips were BF Boise supplied by Grapeworks

For Durif, untoasted oak chips were Oenofirst ROO supplied by Seguin Moreau

- ❖ Remediation of smoke-affected wine is challenging – there is not a quick fix
 - Harder for reds than for whites
- ❖ Minimising skin contact and using only free run juice will reduce the levels of smoke compounds in the juice
- ❖ Carbon can be used to treat smoke affected juice prior to fermentation
 - Reduction in smoke sensory attributes in the resulting wine
 - Reduction in colour depending on carbon type and dose
- ❖ Carbon can reduce the concentrations of volatile phenols in smoke affected wine and reduce the perception of smoke attributes
 - Perform carbon bench trials – optimise dose rate; find the best performing carbon for your wine type
 - Aiming to reduce the smokey attributes while still maintaining some desirable fruit characteristics
- ❖ Not all carbons are equal

- ❖ In recent studies with Victorian producers nanofiltration did not effectively improve wines impacted by smoke
 - Working with the supplier to determine where the problems are situated in their process
- ❖ Dilution of smoke affected wine with non affected wine can reduce the perception of smoke attributes in the resulting wine
- ❖ The sole use of glycosidases will exacerbate the smoke taint problem unless it is used with some other material which removes the volatile phenols liberated
 - The use of glycosidases and carbon may be a suitable mitigation strategy for smoke affected red wine
- ❖ Untoasted oak chips don't reduce the concentrations of smoke compounds but they may add complexity which distracts from the smoke attributes (sweetness, freshness, more fruit) – but dose is important

- ❖ Have a bushfire management plan which incorporates decisions on winemaking
 - Proactive rather than reactive
- ❖ What can your winery tolerate?
 - Whites are easier to remediate than reds
- ❖ How much smoke-affected wine can you make?
 - Is this cost-beneficial?
 - How much can be blended away if that is your only option?
- ❖ Take opportunities to build knowledge where you can
 - Utilise what information is already out there
 - If possible, perform your own trials
 - Speak to other winemakers and their experiences

Acknowledgements

- ❖ Maddy Jiang; Markus Herderich; Mark Krstic
- ❖ The R&D4P smoke taint project was supported by the AWRI, through funding from the Australian Government Department of Agriculture and Water Resources as part of its Rural R&D for Profit programme and Wine Australia
- ❖ Victorian smoke taint remediation trials: Wine Victoria has received funding from the Victorian Government to facilitate the Bushfire Technical Response Program
- ❖ WIC winemaking, Victorian winemakers and sensory panellists
- ❖ The New South Wales Wine Industry Association has received funding from the NSW and the Commonwealth through the Bushfire Industry Recovery Package.
